

The architectural market demands shiny metallic and structural effect coatings and they are used there.

The requirements of the GSB International Quality Regulations for Material Licensing must be fulfilled here as well.

To meet these requirements, material manufacturers modify licensed and established lacquer systems in order to achieve the desired effects. However, testing of coaters who use these modified systems has shown that the required effect can result in the measured reflectometer value deviating from the reflectometer value given in the technical data sheet.

It is therefore recommended to refer to the following in the technical data sheet for these systems:

- The measured reflectometer value can deviate from the value given in the information sheet.
- It is strongly recommended to prepare reference samples.
- The angle at which the installed component is viewed is of vital importance.
